Binary Search Trees

Calvin Higgins

Department of Computer Science and Statistics
University of Rhode Island

November 5, 2025

Warmup Problem

When You Enter The Classroom:

- **Program the following function:**

```
struct Node {
    int value;
    Node* left;
    Node* right;
};
Node* find(Node* root, int target) {.
    // TODO: Return the node with value ‘target‘
    // in the subtree rooted by ‘root‘.
    // Assume ‘root‘ is a valid binary search tree.
}
```

- **Analyze the time complexity:**
  - Assume an input of size n.
  - Give an asymptotic bound on the time complexity of your algorithm.
  - What does your bound mean, in terms of your algorithm(s) runtime?

Write your group's work on the whiteboards!

Lab Directions

Begin These Now:

- **Consider attending the review session:**
  - This Friday at 2:00-4:00PM in Engineering 040
  - Ask your group members if they are going!
- **Create a new project in your IDE for Lab 9**
  - If you aren't sure how to do this
    - Ask a group member
    - Search for documentation
    - Chat with AI
  - If you are still stuck, call over a staff member
- **Work through the lab handout**
  - Available on GitHub under labs/lab-09
  - https://github.com/URI-CSC/212-fall-2015
    - Yes, it is 2015 not 2025
  - All directions available in the lab handout
